

Recommended Use Cases for Basic Next

Where Basic Next is intended to fit - and where it is not yet the right choice.

General-purpose, with an intentional starting point

Basic Next is intended to be a general-purpose language. Its first useful territory is software where readability, explicit structure, and portability matter more than platform-specific tricks or a mature ecosystem on day one.

Strong fits

Command-line tools and automation

BN's explicit entry method, `PRINT`, `INPUT ( )`, types, and small language core fit utilities that read input, transform it, and produce dependable output.

Business and domain applications

Classes, interfaces, visibility, and modules support software organized around real domain concepts: customers, invoices, schedules, inventories, policies, and workflows.

Data-oriented utilities

Explicit numeric types, fixed-size vectors, typed memory, and a future data library direction make BN a credible home for parsers, import/export tools, calculators, and structured data processing.

Teaching and learning

BN can help students see program structure without first navigating an ecosystem full of build systems, framework conventions, or hidden runtime behavior. This is a useful use case, but not the language's sole purpose.

Cross-platform host integrations

The `HOST` capability model is intended to make a program's environmental dependencies visible and portable. It is a direction for the runtime, not a claim that every capability already exists.

Not the first target

BN should not initially be chosen for kernel work, bare-metal firmware, ultra-low-latency systems, performance-critical GPU kernels, or a project that depends on the mature package ecosystem of another language. Those are future evaluation areas, not current promises.

A practical selection rule

Choose BN when the primary value is code that is explicit, approachable, and structured around clear objects and contracts. Choose a mature alternative when its existing runtime, libraries, tooling, or proven operational profile is the decisive requirement.
